INCIDENTS LOGGED

SMART PERIOD ANALYSIS

Assessment: Observed operational risk was moderate, with a improving period-over-period trend.

RISK SCORE	RISK LEVEL	PERIOD TREND	DATA QUALITY
41/100	MODERATE	Improving	Adequate

Performance: Average response 2070.4 ms; p95 response 6247 ms; DNS differences 8933; human reviews required 6474.

Previous comparable period: 2026-08-05 to 2026-08-07 — 11058 checks, 80.44% success, 2 incidents.

Key findings

- 31763 checks completed with a 79.61% success rate; 0 incidents were logged.
- Average HTTP response time was 2070.4 ms and the 95th percentile was 6247 ms.
- 8933 resolver comparisons differed and require corroboration from independent networks.
- 6474 automated classifications were marked for human review.

- Most frequent automated classification: normal (25288).
- Period-over-period trend: improving.

Recommended actions

- Repeat DNS tests from multiple independent networks before classifying interference.
- Complete human review before publishing or attributing automated findings.
- Investigate slow targets and distinguish origin-server performance from access-network degradation.

Automated analysis identifies patterns for human review. It does not by itself establish censorship, attribution, intent, or legal responsibility.

PRE-PUBLICATION VERIFICATION SWEEP

Three full checks per enabled site over ten minutes. Each check records HTTP response, redirects, expected content, TLS, response time, four DNS resolvers, and AI review flags. Results describe the monitoring server vantage point only; adverse or conflicting evidence requires human and cross-network review before publication.

Completed 45 of 45 checks. Human review required: **Yes**.

AGENT ASSESSMENT REPORT ANALYSIS

Period performance describes checks recorded between 2026-08-08 and 2026-08-09; it is not a claim about a site's live status. The agent assessment uses the latest completed automated check available when this PDF was generated. "Recovered" means the latest check succeeded after failures in the selected period. "Needs attention" requires manual and cross-network verification because one automated failure does not prove current unavailability.

Latest agent assessments

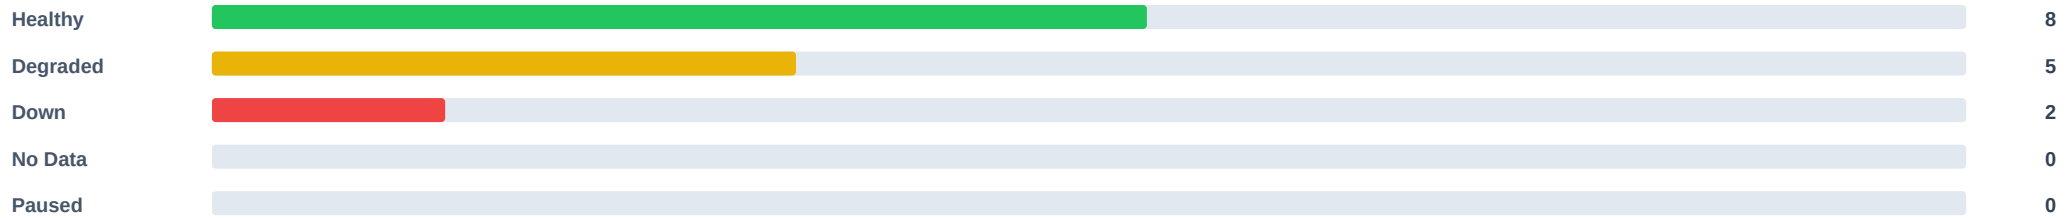

SITE	ASSESSMENT	LATEST COMPLETED CHECK	AGENT ANALYSIS
Allied Peoples Movement (APM) https://apm.org.ng/	UNREACHABLE FROM MONITOR Confidence: Moderate	Failure 2026-08-09 12:52	All three checks received adverse responses from this monitoring server. This does not prove global unavailability and requires another network vantage point.
Peoples Redemption Party (PRP) https://prpng.org/	OPERATIONAL WITH ANOMALIES Confidence: Moderate	Failure 2026-08-09 12:53	All three checks reached the service, but DNS, TLS, content, or AI evidence requires administrator review.
Accord Party (A) https://accordnational.com.ng/	OPERATIONAL Confidence: High	Success 2026-08-09 12:52	All three pre-publication checks reached the expected service without conflicting evidence.

INCIDENT TYPE SUMMARY

No incidents detected during this report period.

INCIDENT LOGS & EVIDENCE

No incidents registered within the specified range.

METHODOLOGY & CAUTIOUS AI CLASSIFICATION POLICY

PAWSOM-MONITOR utilizes automated background agents resolving network paths against multiple public and local DNS servers (Google 8.8.8.8, Cloudflare 1.1.1.1, Quad9 9.9.9.9) and probing port connection status. Classifications are evaluated by LLM reasoning layers. Our system strictly adheres to objective verification standards. Findings of "Censorship" require multi-vantage verification to distinguish local server errors or CDN geo-protection rules from ISP routing manipulation.
